## 1 $\dim \text{col}(A) = \dim \text{row}(A)$

Let  $A = (\mathbf{c}_1 \cdots \mathbf{c}_n)$  with basis for column space  $\{\mathbf{v}_1, \dots, \mathbf{v}_k\}$ , then

$$\begin{aligned}\mathbf{c}_i &= \gamma_{1i}\mathbf{v}_1 + \cdots + \gamma_{ki}\mathbf{v}_k \\ B &:= (\mathbf{v}_1 \cdots \mathbf{v}_k) \in \mathbb{F}^{m \times k} \\ C &:= (\gamma_{ij}) = \begin{pmatrix} \gamma_{1i} \\ \vdots \\ \gamma_{ki} \end{pmatrix} \in \mathbb{F}^{k \times n} \\ &\Rightarrow A = BC\end{aligned}$$

so  $A$  is a linear combo of rows of  $C \Rightarrow \dim \text{row}(A) \leq \dim \text{row}(C) = k = \dim \text{col}(A)$ .

Now applying the same argument to  $A^T$  we see that  $\dim \text{col}(A) \leq \dim \text{row}(A) \Rightarrow \dim \text{col}(A) = \dim \text{row}(A)$ . ■

## 2 $\mathbf{a}$ and $\mathbf{b}$ are orthogonal $\Leftrightarrow |a + b|^2 = |a|^2 + |b|^2$

$$\begin{aligned}|\mathbf{a} + \mathbf{b}|^2 &= \langle \mathbf{a} + \mathbf{b}, \mathbf{a} + \mathbf{b} \rangle = \langle \mathbf{a}, \mathbf{a} \rangle + 2\langle \mathbf{a}, \mathbf{b} \rangle + \langle \mathbf{b}, \mathbf{b} \rangle \\ &= |\mathbf{a}|^2 + 2\langle \mathbf{a}, \mathbf{b} \rangle + |\mathbf{b}|^2\end{aligned}$$

but note that  $\langle \mathbf{a}, \mathbf{b} \rangle = 0$  since  $\mathbf{a}, \mathbf{b}$  are orthogonal.

## 3 Orthogonal Decomposition

There exists a unique  $\lambda$  such that  $\mathbf{a} = \lambda\mathbf{b} + \mathbf{c}$  and  $\langle \mathbf{b}, \mathbf{c} \rangle = 0$ .

Write  $\mathbf{c} = \mathbf{a} - \lambda\mathbf{b}$ , then

$$\begin{aligned}\langle \mathbf{b}, \mathbf{c} \rangle &= 0 \Leftrightarrow \langle \mathbf{b}, \mathbf{a} \rangle - \lambda\langle \mathbf{b}, \mathbf{b} \rangle = 0 \\ &\Leftrightarrow \lambda = \frac{\langle \mathbf{b}, \mathbf{a} \rangle}{\langle \mathbf{b}, \mathbf{b} \rangle}\end{aligned}$$

## 4 Cachy-Schwarz Inequality

Since  $\langle \lambda \mathbf{b}, \mathbf{c} \rangle = 0$ , then  $|\lambda \mathbf{b} + \mathbf{c}|^2 = \lambda^2 |\mathbf{b}|^2 + |\mathbf{c}|^2$ . So  $|\mathbf{c}|^2 = |\mathbf{a}|^2 - \lambda^2 |\mathbf{b}|^2$ .

But  $|\mathbf{c}|^2 \geq 0 \Rightarrow$

$$\begin{aligned} |\mathbf{c}|^2 &= |\mathbf{a}|^2 - \lambda^2 |\mathbf{b}|^2 \\ &= \langle \mathbf{a}, \mathbf{a} \rangle - \frac{\langle \mathbf{a}, \mathbf{b} \rangle^2}{\langle \mathbf{b}, \mathbf{b} \rangle} \langle \mathbf{b}, \mathbf{b} \rangle \\ &= |\mathbf{a}|^2 - \frac{\langle \mathbf{a}, \mathbf{b} \rangle^2}{|\mathbf{b}|^2} \geq 0 \end{aligned}$$

Multiplying both sides, rearranging and taking roots,

$$|\langle \mathbf{a}, \mathbf{b} \rangle| \leq |\mathbf{a}| |\mathbf{b}|$$

From this we get that  $-1 \leq \frac{\langle \mathbf{a}, \mathbf{b} \rangle}{|\mathbf{a}| |\mathbf{b}|} \leq 1$ , hence there exists a unique  $\theta \in [0, \pi]$  such that

$$\langle \mathbf{a}, \mathbf{b} \rangle = |\mathbf{a}| |\mathbf{b}| \cos \theta$$

## 5 Fourier Coefficients

Let  $\mathbf{u}_1, \dots, \mathbf{u}_n$  be an orthonormal basis of  $V$ . Then if  $w \in V$

$$\mathbf{w} = \sum_{i=1}^n \langle \mathbf{w}, \mathbf{u}_i \rangle \mathbf{u}_i$$

**Proof.** Let  $\mathbf{w} = \sum_{i=1}^n x_i \mathbf{u}_i$ . Then  $\langle \mathbf{w}, \mathbf{u}_j \rangle = \sum_{i=1}^n x_i \langle \mathbf{u}_i, \mathbf{u}_j \rangle = x_j$  since the  $\mathbf{u}_i$  are orthonormal.

## 6 Orthogonal Complement of a Subspace

$$U^\perp = \{ \mathbf{v} \in V \mid \langle \mathbf{v}, \mathbf{u} \rangle = 0 \ \forall \mathbf{u} \in U \}$$

Furthermore if  $W = \text{span } U$ , then  $W \cap U^\perp = \{ \mathbf{0} \}$ .

We can visualize  $W^\perp$  in matrix terms. Let  $A \in K^{m \times n} : \text{col}(A) = \text{span } U = W$  where  $A = (\mathbf{u}_1 \dots \mathbf{u}_n)$ .

Now we are interested in  $\mathbf{v} \in U^\perp : \langle \mathbf{v}, \mathbf{u}_i \rangle = 0$  for all  $i$ . This is equivalent to  $A^T \mathbf{v} = (\langle \mathbf{u}_1, \mathbf{v} \rangle \dots \langle \mathbf{u}_n, \mathbf{v} \rangle)^T = \mathbf{0}$ .

$$\Rightarrow W^\perp = \mathcal{N}(A^T)$$

We also have  $\dim \mathcal{N}(A^T) = \dim \mathcal{N}(A)$  and  $\dim \text{row}(A^T) = \dim \text{col}(A)$  so

$$\dim W + \dim W^\perp = m$$

### 6.1 $V = W \oplus W^\perp$

Let  $\mathbf{v} \in V$  and  $\mathbf{u}_1, \dots, \mathbf{u}_k$  be an orthonormal basis of  $W$ . Then we can put  $\mathbf{y} = \mathbf{v} - \sum_{i=1}^k \langle \mathbf{v}, \mathbf{u}_i \rangle \mathbf{u}_i$ . Since the  $\mathbf{u}_i$  are orthonormal, we have  $\langle \mathbf{y}, \mathbf{u}_i \rangle = 0$  and so  $\mathbf{y} \in W^\perp$ .

Thus  $V = W + W^\perp$  and since  $W \cap W^\perp = \{ \mathbf{0} \}$ , we get  $V = W \oplus W^\perp$ . ■

## 7 Gram-Schmidt Method

This is an algorithm for producing orthonormal basis from a general basis. Let  $\mathbf{v}_1, \dots, \mathbf{v}_k$  be a basis.

1. Normalize  $\mathbf{v}_1$  by putting  $\mathbf{u}_1 = \frac{\mathbf{v}_1}{|\mathbf{v}_1|}$ .
2. Remove the projection of  $\mathbf{u}_1$  from  $\mathbf{v}_2$  as follows:
  1. Set  $\mathbf{v}'_2 = \mathbf{v}_2 - \langle \mathbf{v}_2, \mathbf{u}_1 \rangle \mathbf{u}_1$ .
  2. Normalize by letting  $\mathbf{u}_2 = \frac{\mathbf{v}'_2}{|\mathbf{v}'_2|}$ .
3. Now repeat the process:
  1.  $\mathbf{v}'_3 = \mathbf{v}_3 - \langle \mathbf{v}_3, \mathbf{u}_1 \rangle \mathbf{u}_1 - \langle \mathbf{v}_3, \mathbf{u}_2 \rangle \mathbf{u}_2$ .
  2.  $\mathbf{u}_3 = \frac{\mathbf{v}'_3}{|\mathbf{v}'_3|}$ .
4. And so on.

## 8 $d(\mathbf{a}, \mathbf{c}) \leq d(\mathbf{a}, \mathbf{b}) + d(\mathbf{b}, \mathbf{c})$

Denote the sides of a triangle by  $\mathbf{a} = \mathbf{b} + \mathbf{c}$ .

$$\begin{aligned}\langle \mathbf{a}, \mathbf{a} \rangle &= \langle \mathbf{b}, \mathbf{b} \rangle + 2\langle \mathbf{b}, \mathbf{c} \rangle + \langle \mathbf{c}, \mathbf{c} \rangle \\ &\leq \langle \mathbf{b}, \mathbf{b} \rangle + 2|\langle \mathbf{b}, \mathbf{c} \rangle| + \langle \mathbf{c}, \mathbf{c} \rangle \\ &\leq \langle \mathbf{b}, \mathbf{b} \rangle + 2|\mathbf{b}||\mathbf{c}| + \langle \mathbf{c}, \mathbf{c} \rangle \\ &= |\mathbf{b}| + 2|\mathbf{b}||\mathbf{c}| + |\mathbf{c}| \\ &= (|\mathbf{b}| + |\mathbf{c}|)^2\end{aligned}$$

using the Cauchy-Schwarz inequality.

## 9 Least Squares Principle

Let  $\mathbf{v} = \mathbf{w} + \mathbf{y}$ , with  $\mathbf{w} \in W$  and  $\mathbf{y} \in W^\perp$ . Then  $d(\mathbf{v}, W) = |\mathbf{y}|$ .

Let  $\mathbf{w}' = \mathbf{w} + \mathbf{m}$ , then  $\mathbf{v} - \mathbf{w}' = \mathbf{y} + \mathbf{m}$

$$d(\mathbf{v}, \mathbf{w}')^2 = |\mathbf{y} + \mathbf{m}|^2 = |\mathbf{y}|^2 + |\mathbf{m}|^2 \geq 0$$

since  $\mathbf{y}$  and  $\mathbf{m}$  are orthogonal.

But

$$d(\mathbf{v}, \mathbf{w})^2 = |\mathbf{y}|^2 \geq 0$$

so  $d(\mathbf{v}, \mathbf{w}) \leq d(\mathbf{v}, \mathbf{w}')$  for all  $\mathbf{w}' \in W$ .

## 10 Vector Space Quotients

$$\dim V/W = \dim V - \dim W$$

Suppose  $A \in \mathbb{F}^{m \times n}$ , then  $\mathbb{F}^n/\mathcal{N}(A)$  are the solution sets for  $A\mathbf{x} = \mathbf{b}$  where  $\mathbf{b}$  varies through  $\mathbb{F}^m$ .

$\mathcal{N}(A)$  corresponds to  $A\mathbf{x} = \mathbf{0}$ , and  $\mathbf{p} + \mathcal{N}(A)$  corresponds to  $A\mathbf{p} = \mathbf{b}$ .

### 10.1 $\dim(V + W)/W = \dim V/(V \cap W)$

$$\begin{aligned}\dim(V + W)/W &= (\dim V + \dim W - \dim(V \cap W)) - \dim W \\ &= \dim V - \dim(V \cap W) \\ &= \dim V/(V \cap W)\end{aligned}$$
