1  $K[x, y]/\langle x - a_1, y - a_2 \rangle \cong K$

1

1  $K[x, y]/\langle x - a_1, y - a_2 \rangle \cong K$

Let  $P = (a_1, a_2)$  and  $\phi$  be the evaluation map

$$\phi : K[x, y] \rightarrow K$$

$$\phi(f(x, y)) = f(P)$$

then  $\phi(K) = K$  so we see  $\phi$  is surjective.

We also see  $K[x, y]/\ker \phi \cong K$ . Since the map is surjective, and  $K$  is a field, therefore  $\ker \phi$  is maximal.

Now we prove  $\ker \phi = \langle x - a_1, y - a_2 \rangle$ . We can easily see  $\langle x - a_1, y - a_2 \rangle \subseteq \ker \phi$ , so now we prove the reverse inclusion. We write  $f(x, y) = \sum f_i(x)y^i$  and then see  $f(x, a_2) = \sum f_i(x)a_2^i$ .

$$f(x, y) - f(x, a_2) = \sum f_i(x)(y^i - a_2^i)$$

but  $(y^i - a_2^i) = (y - a_2)(y^{i-1} + \dots + a_2)$

$$\Rightarrow f(x, y) - f(x, a_2) \in \langle y - a_2 \rangle$$

Continuing with the same argument for  $x$ , and noting  $f(a_1, a_2) = 0$ , we see

$$f(x, y) \in \langle x - a_1, y - a_2 \rangle \Rightarrow \ker \phi = \langle x - a_1, y - a_2 \rangle$$
