## 1 Matrix Multiplication

Let  $A \in \mathbb{F}^{m \times n}$  and  $B \in \mathbb{F}^{n \times p}$ , then  $AB \in \mathbb{F}^{m \times p}$ 

$$(AB)_{ik} = \sum_{j=1}^{n} a_{ij} b_{jk}$$

## 1.1 Column Multiplication

$$\begin{split} A &= (\mathbf{a}_1 {\cdots} \mathbf{a}_n) \\ (AB)_{:r} &= b_{1r} \mathbf{a}_1 + b_{2r} \mathbf{a}_2 + \cdots + b_{n1} \mathbf{a}_n \end{split}$$

### 1.2 Row Multiplication

$$\begin{split} B = \begin{pmatrix} \mathbf{b}_1 \\ \vdots \\ \mathbf{b}_n \end{pmatrix} \\ (AB)_{r:} = a_{r1}\mathbf{b}_1 + a_{r2}\mathbf{b}_2 + \dots + a_{rn}\mathbf{b}_n \end{split}$$

# 2 Uniqueness of Reduced Row Echelon Form

## $\textbf{2.1} \quad A' = EA \Rightarrow \mathbf{row}(A') = \mathbf{row}(A)$

The row operations are:

- 1. interchange different rows
- 2. multiply rows by nonzero scalar
- 3. add a nonzero multiple of another row

We show A has equivalent row space under row operations.

Type 1 is immediate.

Type 2 replaces  $\mathbf{a}_i$  by  $r\mathbf{a}_i$ , so we just rescale by 1/r.

$$c_1\mathbf{a}_1 + \dots + c_n\mathbf{a}_n = \frac{c_1}{r}\mathbf{a}_1' + \dots + c_n\mathbf{a}_n$$

Type 3 replaces  $\mathbf{a}_i$  by  $\mathbf{a}_i + r\mathbf{a}_j$ 

$$\begin{aligned} c_1 \mathbf{a}_1 + c_2 \mathbf{a}_2 + \dots + c_n \mathbf{a}_n &= c_1 (\mathbf{a}_1 + r \mathbf{a}_2) + (c_2 - r c_1) \mathbf{a}_2 + \dots + c_n \mathbf{a}_n \\ &= c_1 \mathbf{a}_1' + (c_2 - r c_1) \mathbf{a}_2' + \dots + c_n \mathbf{a}_n' \end{aligned}$$

So A and A' have the same row space.

## 2.2 $A = B : A, B \in \mathbf{Red} \Leftrightarrow \mathbf{row}(A) = \mathbf{row}(B)$

 $A = B \Rightarrow \text{row}(A) = \text{row}(B)$  is obvious so we prove the reverse direction.

Label the rows of A, B like so starting from the bottom.

$$A = \begin{pmatrix} \mathbf{a}_n \\ \vdots \\ \mathbf{a}_1 \end{pmatrix}, \qquad B = \begin{pmatrix} \mathbf{b}_n \\ \vdots \\ \mathbf{b}_1 \end{pmatrix}$$

We induct on the pivots starting with  $\mathbf{a}_1, \mathbf{b}_1$ .

- 1. the pivots for  $\mathbf{a}_1, \mathbf{b}_2$  must be the same otherwise  $\mathbf{a}_1 \notin \text{row}(B)$ .
- 2. By symmetry, the pivots of  $\mathbf{a}_1$  and  $\mathbf{b}_1$  are in the same component.
- 3.  $\mathbf{b}_1 = r_1 \mathbf{a}_1 + \dots + r_n \mathbf{a}_n$  but the other components don't share pivots  $\Rightarrow \mathbf{b}_1 = r_1 \mathbf{a}_1$ .
- 4.  $r_1 = 1$

Keep applying the same argument to see A = B.

### 2.3 Reduced Form is Unique

If two different sequences of elementary matrices corresponding to row operations yield two different reduced row echelon forms B and C for A, then by the previous propositions we get:

- 1. row(A) = row(B) = row(C)
- 2. B = C

#### 3 Exercises

#### 3.1 Ex 3.1.2

$$\begin{split} A &= (a_{ij}), \qquad A^T = (a_{ij})^T = a_{ji} \\ (A+B)^T &= ((a_{ij}) + (b_{ij}))^T = a_{ji} + b_{ji} = A^T + B^T \end{split}$$

#### 3.2 Ex 3.1.5

We use these simple rules:

$$\begin{split} (XY)^T &= Y^T X^T \\ (X_{k,\cdot})^T &= (X^T)_{,k} \end{split}$$

and the column notation

$$(XY), k = Y_{1,k}X_{.1} + \dots + Y_{n,k}X_{.n}$$

Putting this all together

$$\begin{split} (AB)_{,k}^T &= (B^TA^T)_{,k} = (A^T)_{1,k}(B^T)_{,1} + \dots + (A^T)_{n,k}(B^T)_{,n} \\ &= A_{k,1}B_{1,} + \dots + A_{k,n}B_{n.} \end{split}$$

but  $(AB)_{,k}^T = (AB)_{k,}$
